

Formal TXID list — the volume test on Cardano Preprod

Milestone 3 evidence: "*List of transaction identifiers associated milestone test anchors*". The 180 TXIDs also appear in the appendix of the [volume test report](#). This document is the formal publication, in a location intended for that purpose, with every single TXID re-verified against the live chain — not merely against what the application's own database reports — on the day of publication.

Deliberately scoped to the volume test only. The repository holds TXIDs from other moments (`torre-a`, ad-hoc fixes made throughout September) that are intentionally excluded here — mixing them in would have produced a longer, less legible list. These 180 are a clean, complete set: 3 new projects, 10 stages each, all 6 on-chain transactions per stage, with no gaps and no padding from unrelated runs.

Source: the working document `specs/EVIDENCIA-2026-09-11-lista-formal-de-txids.md`, as of 2026-09-21.

The data file

[txids-volume-test-2026-09-10.csv](#) — 180 rows, one per transaction. Columns:

Column	Meaning
<code>project</code>	The project name (Torre Volumen 1 / 2 / 3)
<code>stage_number</code>	Stage sequence number (1–10)
<code>stage_name_en</code>	Stage name, in English
<code>stage_name_es</code>	Stage name as it is stored and shown in the product (default locale <code>es-AR</code>)
<code>transition</code>	Which on-chain action this row records: mint (initial declaration), evidence anchor, or one of the four stage-FSM transitions (auto-advance, observe, resume, certify)
<code>event</code>	The underlying event type as stored in <code>OnChainEvent</code> : <code>STAGE_CREATED</code> , <code>EVIDENCE_ANCHOR</code> , or <code>STAGE_TRANSITION</code>
<code>txid</code>	The Cardano transaction hash, verbatim, case-sensitive
<code>network</code>	Always <code>Preprod</code> — mainnet is out of scope for this milestone by owner decision (D-013)
<code>explorer_preprod</code>	Direct, clickable Cardanoscan Preprod link for that transaction
<code>koios_confirmations_2026-09-11</code>	Confirmation depth measured against Koios on the day this document was published (see below)

Methodology

1. **Source.** The appendix of the [volume test report](#), parsed with a script rather than transcribed by hand, to avoid repeating a copy error across 180 rows.
2. **Independent re-verification on 2026-09-11**, against Koios (`preprod.koios.rest`, a public, read-only API — not the project's own node and not the application's database), the same method already used to close SOM criterion 9. All 180 TXIDs were submitted to `POST /api/v1/tx_status` in batches of 40 (the endpoint rejects request bodies over 5 KB), and **all 180 returned a real, confirmed**

transaction, with between **3,065 and 3,761 confirmations** each at the time of the run — months of margin over any reasonable Preprod reorg depth.

3. **Zero "not found," zero "still pending."** Had any transaction come back unconfirmed, it would not have shipped in this list — the same rule 17 that governs the product's UI ("never display a proof signal that cannot be substantiated"), applied here to a document instead of a screen.

Summary

Total TXIDs	180
Projects	Torre Volumen 1, Torre Volumen 2, Torre Volumen 3 — 60 each
Stages	10 per project (30 total)
By event type	30 STAGE_CREATED (mint) · 30 EVIDENCE_ANCHOR · 120 STAGE_TRANSITION
Network	Preprod, all 180
Database status	Confirmed , all 180
Re-verified against Koios	180/180, on 2026-09-11
