Pilot Report

Pilot execution on Cardano mainnet: metrics, successes, incidents and the notary's attestation on data integrity

Project Catalyst 1400106 · Real-World Real Estate: Pre-Sale with Proof & Release · October 31, 2026

Pilot Report

This document is the evidence for **Output 1** of Milestone 4: *"Pilot execution with one notary and two developers; real data; ≥2 releases per pilot; fallback/drill scenarios."* It reports the pilot's metrics against Criterion 1, its successes and incidents, and the notary's attestation on data integrity, as Evidence 1 asks. All figures were read from the mainnet deployment on **October 31, 2026** and checked against the public Cardano mainnet ledger.

The pilot ran one real project — Cabildo 4987, Av. Cabildo 4987, Núñez, Buenos Aires — end to end on Cardano mainnet: 10 construction stages certified, 63 real project documents fingerprinted and anchored in 15 evidence bundles, one unit sold under a signed contract, the unit's dossier signed by the notary, and the full contract amount recorded as released. Every one of its 48 transactions was verified on a public explorer, and every stored document re-hashes to the fingerprint anchored on-chain.

Scope

Project	Cabildo 4987 — 30 functional units, 10 construction stages, status *Delivered*
Data	The real documents of the project: plans, permits, certificates, surveys, site photographs
Network	Cardano mainnet (`https://propnexus-web-mainnet.onrender.com`)
Participants	The developer of the project, a certifier, the notary, the buyer of unit UF 12 · 5°A, and the platform operator — one account each, every one bound to its role and to this project
Unit followed end to end	UF 12 · 5°A — 5th floor, 58 m², USD 146,100

Scope decision. The pilot was run with **one project**, the one already anchored on mainnet, and its results are reported as they were measured. The targets of Criterion 1 that depend on volume — several projects, many contracts, many wallets — are therefore not reached, and the table below says so line by line.

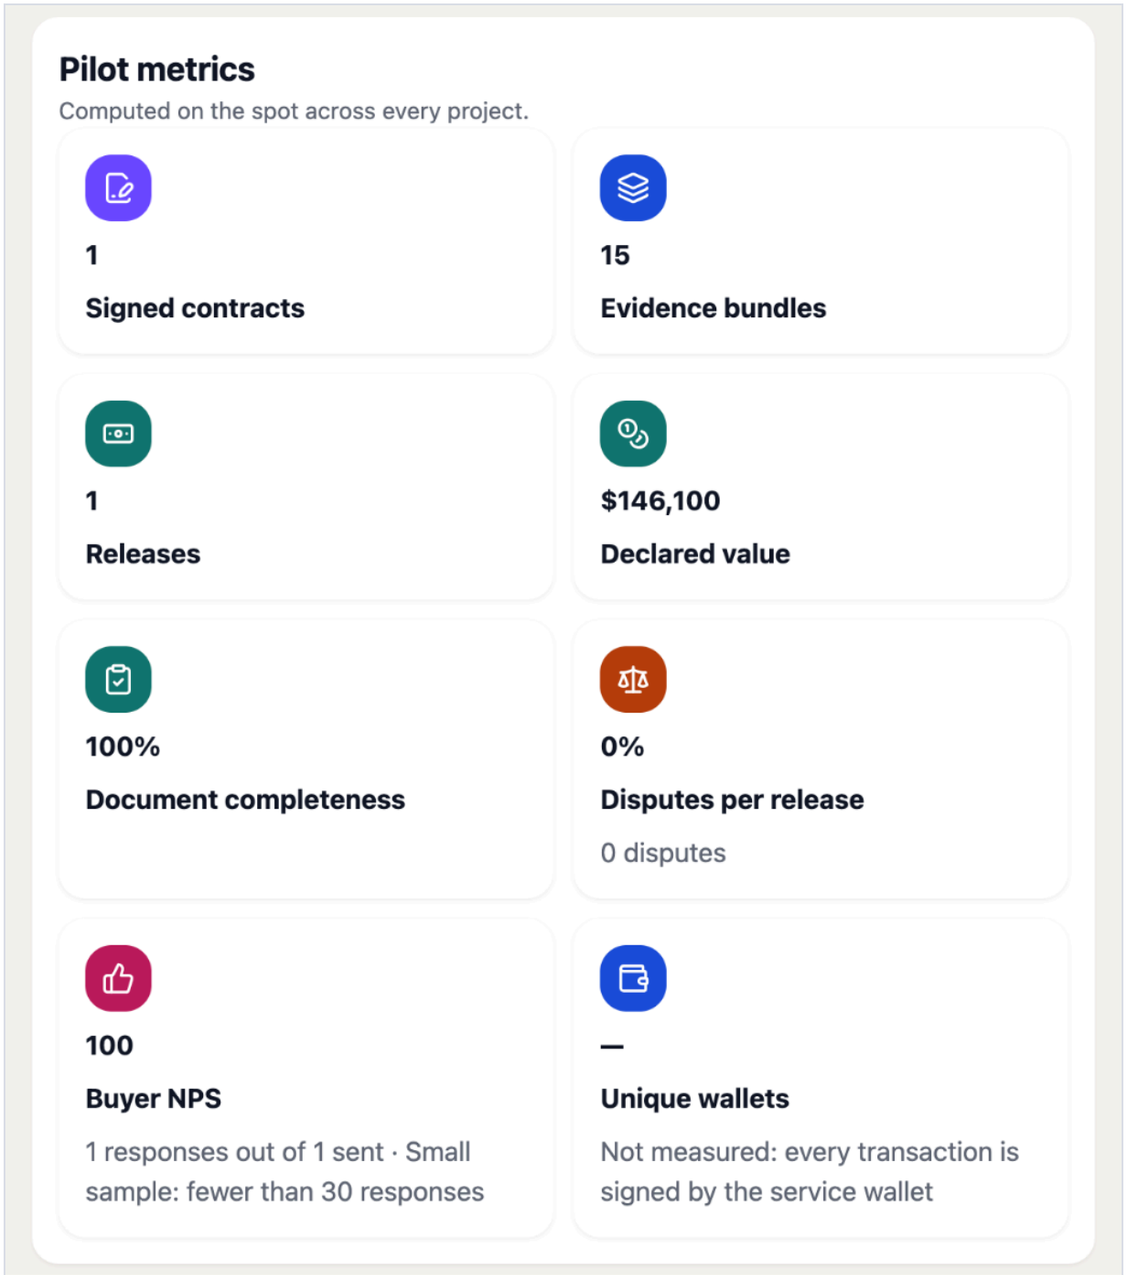

1 • Metrics against Criterion 1

Criterion 1	Target	Pilot result	
Development pilots onboarded	≥ 2	**1**	Not reached
Signed contracts	≥ 10	**1**	Not reached
Evidence bundles hashed	≥ 20	**15**	Not reached
Releases	≥ 15 (≥ 2 per pilot)	**1**	Not reached
Document completeness	≥ 95 %	**100 %**	Met
Disputes	≤ 3 %	**0 %** (0 disputes over 1 release)	Met
Buyer NPS	≥ 70	**100** (1 response out of 1 sent: below the 30-response minimum for a stable score)	Met, on a sample of one
Unique wallets across pilots	≥ 120	**1** — every transaction is signed by the platform's service wallet	Not reached

Criterion 1	Target	Pilot result	
Value of the developments on the platform	≥ 800,000 USDM	**USD 3,665,414.93** (the 30 units of Cabildo 4987, priced in US dollars, not USDM)	Met in value, in USD

How each figure is computed:

- **Document completeness** is the share of each unit's required artifacts that carry an on-chain reference. For the dossier of UF 12 · 5°A, 73 of 73 artifacts (10 stages and 63 documents) are anchored.
- **Disputes** are counted per release, so the rate exists only once there is a release.
- **NPS** is asked once per buyer, automatically, with their first release; the buyer answered 9.
- **Unique wallets** is not measured in this design: participants do not sign with their own wallets; the platform signs every anchor with its service wallet, and attributes each action to the identity-bound account that performed it.

The pilot metrics, as the admin panel of the mainnet deployment computes them.

2 • How the pilot ran

Timeline (October 31, 2026, UTC)

Time	What happened
17:54 – 18:06	Service wallet funded; reference script published on mainnet
18:43	Project created; its 10 stage threads opened on-chain (10 transactions)
19:07 – 19:32	63 documents uploaded and fingerprinted, anchored in 15 evidence bundles
19:07 – 19:30	Work started on each stage (`Pending → InProgress`)
19:40 – 19:51	The certifier certified the 10 stages (`InProgress → Completed`)
20:21	The buyer accepted the invitation to unit UF 12 · 5°A; contract signed
20:22	The notary signed the unit's dossier
21:33	The full contract amount recorded as released at stage 10; the buyer answered the NPS survey

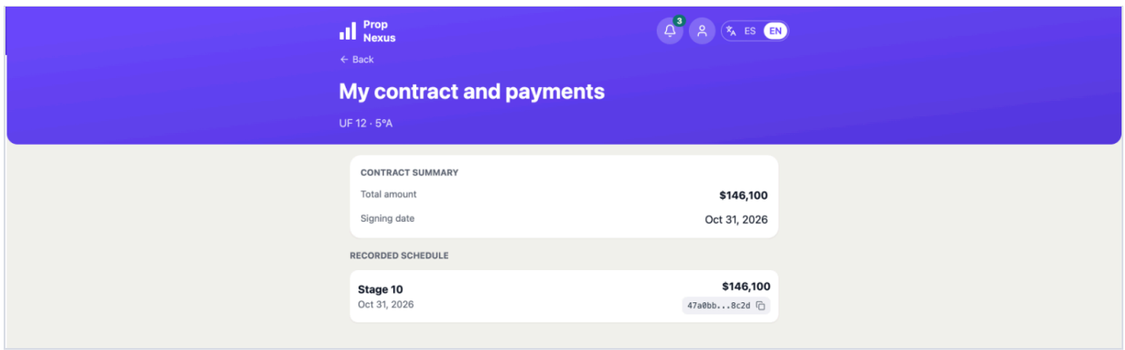

These timestamps record **when each artifact entered the record**, not when the construction work took place: the project's documents were registered on mainnet in a single session.

The ten stages

#	Stage (as recorded, es-AR)	English	Files	Work started (UTC)	Completed (UTC)	Completion transaction
1	Proyecto y Registro	Project and registration	2	19:08	19:40	`591273c7727ef9c8…`
2	Certificaciones de servicios y Estudio de suelos	Utility certifications and soil study	2	19:17	19:43	`dfad5a0ba41b4d93…`
3	Permiso de Ejecución de Obra Civil y comercialización	Civil works permit and sales authorization	3	19:18	19:43	`f8cb4f71b9ebf6bc…`
4	Inicio de obra y excavación	Construction start and excavation	3	19:20	19:46	`9a549bfec91123af…`
5	Fundaciones y estructura de planta baja	Foundations and ground-floor structure	11	19:20	19:47	`07ced4eea22021f9…`
6	Estructura de niveles superiores	Upper-floor structure	14	19:23	19:48	`262bb75c262b74c8…`
7	Instalaciones y terminaciones	Building services and finishes	2	19:26	19:49	`a6ea8cde9195a90f…`
8	Final de obra	Construction completion	4	19:28	19:50	`35fd5682499111d4…`
9	Mensura y División en Propiedad Horizontal	Survey and horizontal-property subdivision	2	19:29	19:51	`5988ab38e6301210…`
10	Escrituración por unidad funcional y entrega del inmueble finalizado	Deed per unit and handover of the finished property	20	19:30	19:52	`11a0a5a532f04a90…`

Releases

One release was recorded, for the full contract amount, at stage 10 (*Deed per unit and handover of the finished property*): USD 146,100.00, anchored in transaction `47a0bb3d…568c2d`. A release is the record of a payment made **outside** the platform — the platform never holds or moves funds. The output asks for at least two releases per pilot; the pilot recorded the payment as a single release.

The buyer's contract view, with the release recorded at stage 10 and its transaction ID.

Fallback and drill scenarios

The fallback scenarios were **not exercised on mainnet** in this pilot: the ten stages of Cabildo 4987 went from `InProgress` to `Completed` without being observed, and no dispute was opened. The mechanisms are in production and were exercised before:

- **Failed inspection → rework → re-certification** is the `Observed ⇄ InProgress` branch of the stage state machine, enforced both by the backend and by the on-chain validator. It was exercised on 30 stages during the Milestone 3 volume test on Preprod (180 confirmed transactions).
- **Disputes** between the parties of a stage are recorded by the platform and counted in the dispute rate above.

3 · Successes

- **Real project, real documents, on mainnet.** A complete construction record — from the project registration to the deed and handover — was structured into 10 stages and anchored on Cardano mainnet.
- **Independent verification works.** Without relying on the platform's own word:
  - all **48** transaction IDs were found on mainnet through an independent API (Koios);
  - all **15** evidence-bundle Merkle roots were recomputed from the document hashes and match the roots on-chain;
  - all **63** stored documents (115.7 MB) were downloaded and hashed again, and every one reproduces the fingerprint that was anchored.
- **Certification rules held.** No stage could be completed without its evidence; document completeness is 100 %.
- **The professional output is usable.** The notary reviewed and signed the dossier of UF 12 · 5°A in the platform, and that signature is itself anchored and verifiable (§5).
- **No server errors.** Sentry shows no issues and Grafana shows no 5xx responses on mainnet (Evidence 2, §5).
- **Participants' feedback.** The participants reported that the platform works well, is satisfactory, and meets their requirements.

4 · Incidents

There were no incidents during the pilot: no data was lost or altered, and no anchor failed — all 48 transactions ended `Confirmed`.

Three defects were found while running the pilot, fixed the same day, and deployed through CI before the pilot ended. None affected the data:

Fix	What it was	Data impact
`c848681`	When several files were anchored together in one bundle, the screens looked the anchor up only for the first file, so the others showed *Pending* (seen in stage 1). The on-chain Merkle root always covered all the files	None — all 15 bundle roots verify against all 63 files
`cfc9f97`	Units were listed in text order (UF 1, UF 10, UF 11…) instead of by number	None — display only
`fe06df0`	The exported dossier PDF lost accented characters, `°` and `·`	None — export formatting only

5 · Notary attestation on data integrity

The notary attested to the integrity of the pilot's records **in the platform itself**, by signing the dossier of unit UF 12 · 5°A — and that signature is anchored on mainnet.

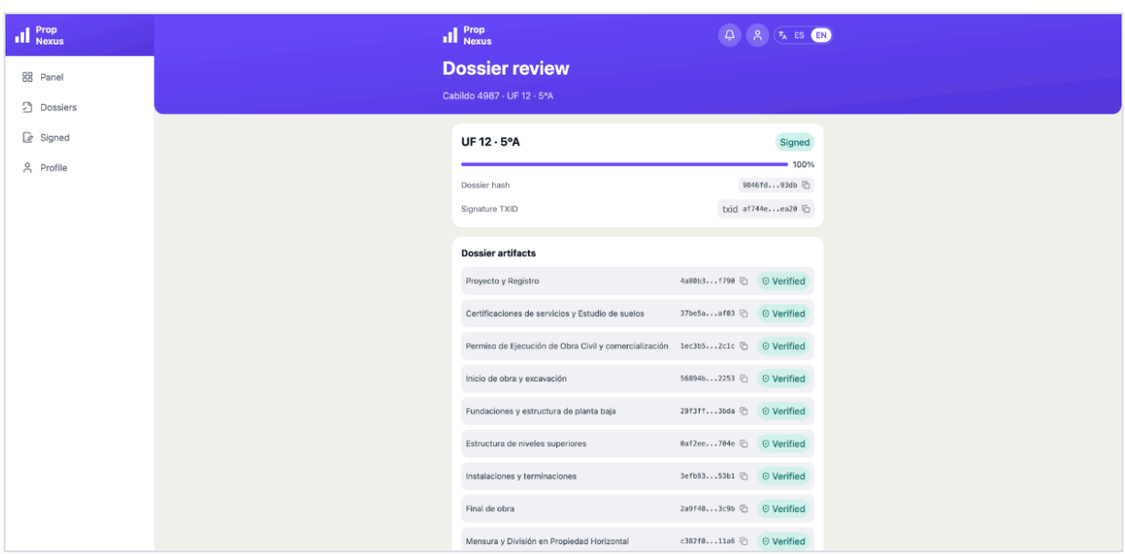

Dossier	`bitobzet1jkm3hzj39ufqx0j` — unit UF 12 · 5°A, Cabildo 4987
Contents	10 stages and 63 documents, each with its SHA-256 hash and anchor transaction
Master hash (what was signed)	`9846fd9b112416a1fb6cd5b4119e385198006685b659ce799f214016a0f393db`
Signed	October 31, 2026, 20:22:11 UTC, by the notary's account
Signature transaction	`af744e52c9ef141e61fd8c6da9609cf6f51f57e026bc06bfe7d778f1b376ea20`

How the attestation was verified.

1. The master hash was recomputed from the 73 artifacts of the dossier (10 stages and 63 documents, with their hashes and transactions): it is exactly `9846fd9b…93db`.
2. The commitment in the signature transaction's metadata was recomputed from the dossier ID, that master hash and the signing time: it is exactly the value on-chain, `4ed36503…9c8bfb`.
3. The 63 documents behind the dossier re-hash to their recorded fingerprints (§3).

The signature covers the dossier **as it was at 20:22:11 UTC**. The payment release recorded at 21:33 the same day is outside what the notary signed, and has its own transaction.

The Council of Experts format of the Whitepaper also calls for a written sign-off. The notary's sign-off on data integrity, which lists the same artifacts and states what the attestation does and does not cover, is submitted alongside this report as `M4-Sign-off-Notary-Data-Integrity.pdf`.

The signed dossier in the notary's view: status *Signed*, the master hash and the signature transaction.
